

Changes to computer path to use Vscript from the command prompt

In order to run Vscript from a command prompt (e.g. to execute a script, run DSM2, etc), the directory containing vscript must be listed in the “path” on the computer. To add the directory with vscript follow the directions below.

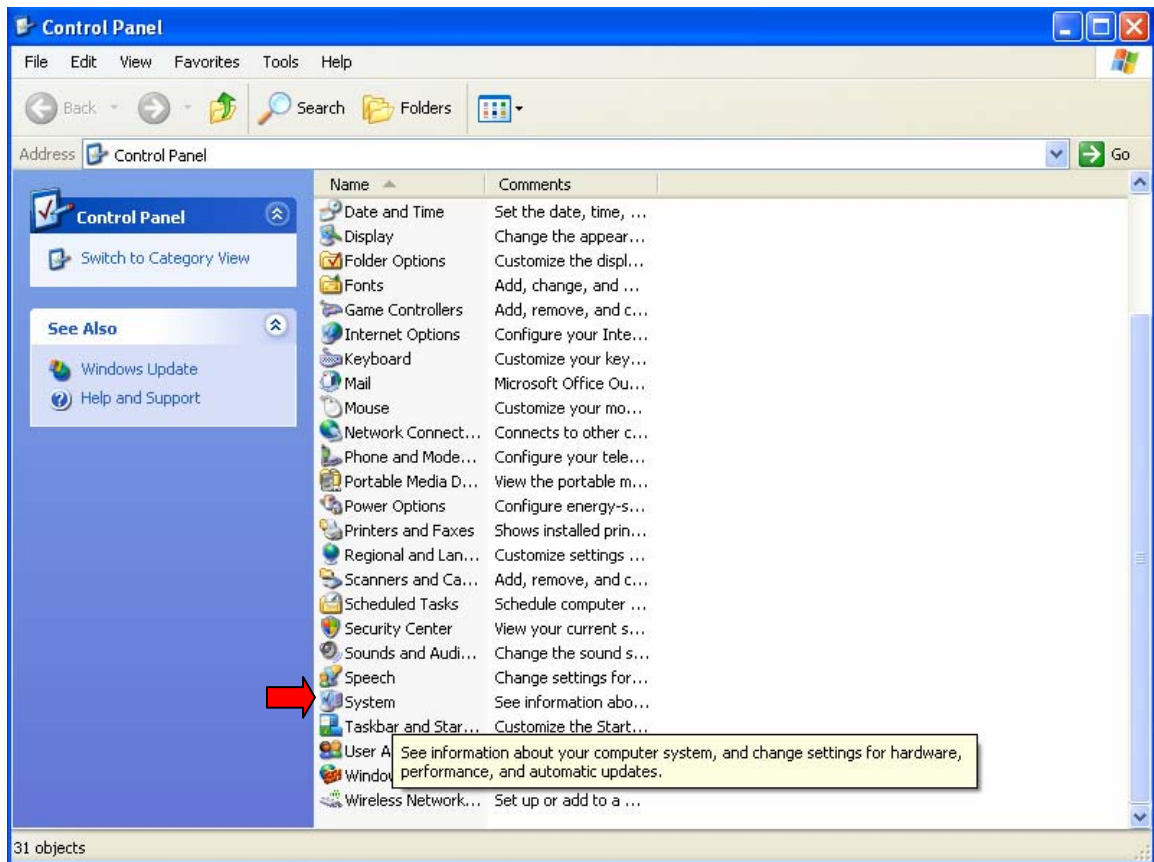

1. Locate the directory with the *vscript.bat* file. In this example, the directory is D:\vista\bin.
2. Left click on the start menu button, go to Settings, and select Control Panel

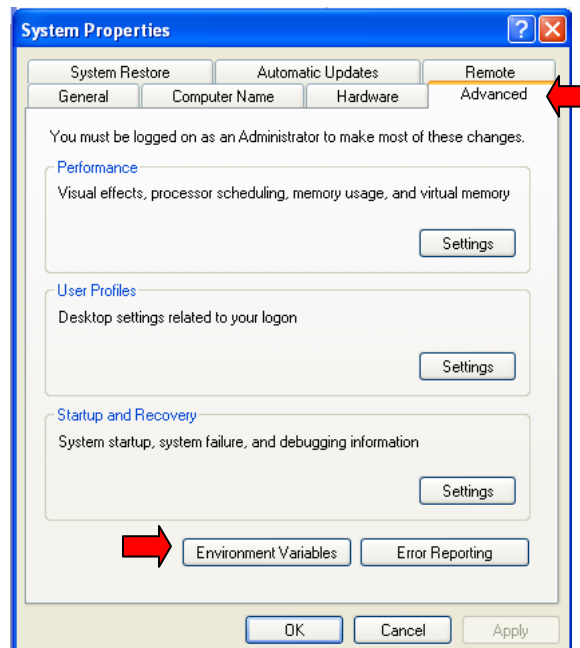

3. From the left side of the Control Panel, select switch to Classic View

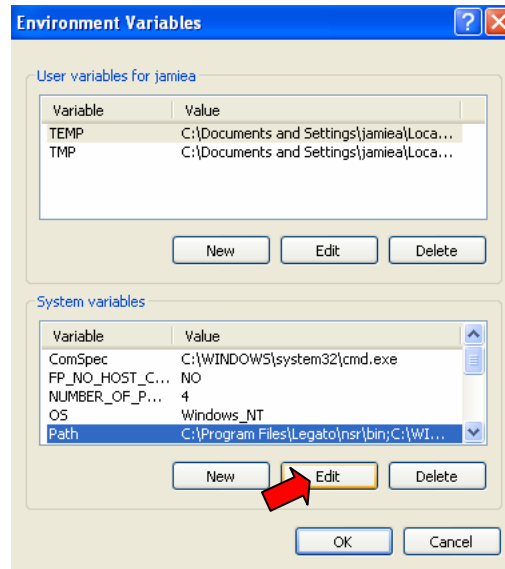

4. Double click on the System folder.

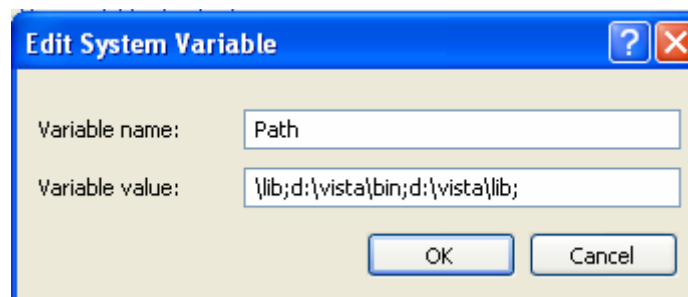

5. A window titled system properties will open. Select the Advanced tab on the far right. Click on the Environment variables button at the lower left of the window.

6. In the System variables window in the bottom half of the System Properties window, left click on the Path variable to select it. Then left click on the edit button.

7. At the end of the path listed in the path window, add the following text for the vista bin and vista lib directories: (semi-colon, vista path, semi-colon)
;D:\vista\bin;D:\vista\lib;
DO NOT CHANGE ANYTHING ELSE in the path!!!!!!
Click on the OK button in the Path window when finished. Click on the OK button in the environment variables window. Click on OK in the system properties window.

8. Now Vscript should run from a command prompt
